- LFM is calculated by the formula (Live Sample Weight–Dry Sample Weight)/Dry Sample Weight.
- 60% is generally recognized as approaching a critical level of live-fuel moisture.
- Sampling date: Los Angeles Basin sites were sampled 5/11/22, Santa Monica Mountains 5/11/22, Santa Clarita Valley 5/11/22, and High Country sites 5/11/22.

### LIVE FUEL MOISTURE SUMMARY / FIRE DANGER ZONE DISCUSSION

Live Fuel Sampling is being reestablished at 4 Historic sites: Woolsey Canyon, Tanbark Flats, Templin Highway & Soledad Road. The addition of these sites will allow for the tracking of LFM in the High Country and Los Angeles Basin. The Santa Monica Mountains, Santa Clarita Valley and All Areas All Fuels Data sets and Graphs remain unchanged by these additions.

On average we are seeing Live Fuel Moisture values across all areas in Los Angeles County are declining, reflecting the 1981-present the trend line. We are currently seeing all plant species sampled in Los Angeles County are flowering.
